```
internet address = 142.104.6.1
```

```
-> active.uvic.ca
```

```
internet address = 142.104.96.2
```

Q: recursive or not recursive

Recursive vs iterative

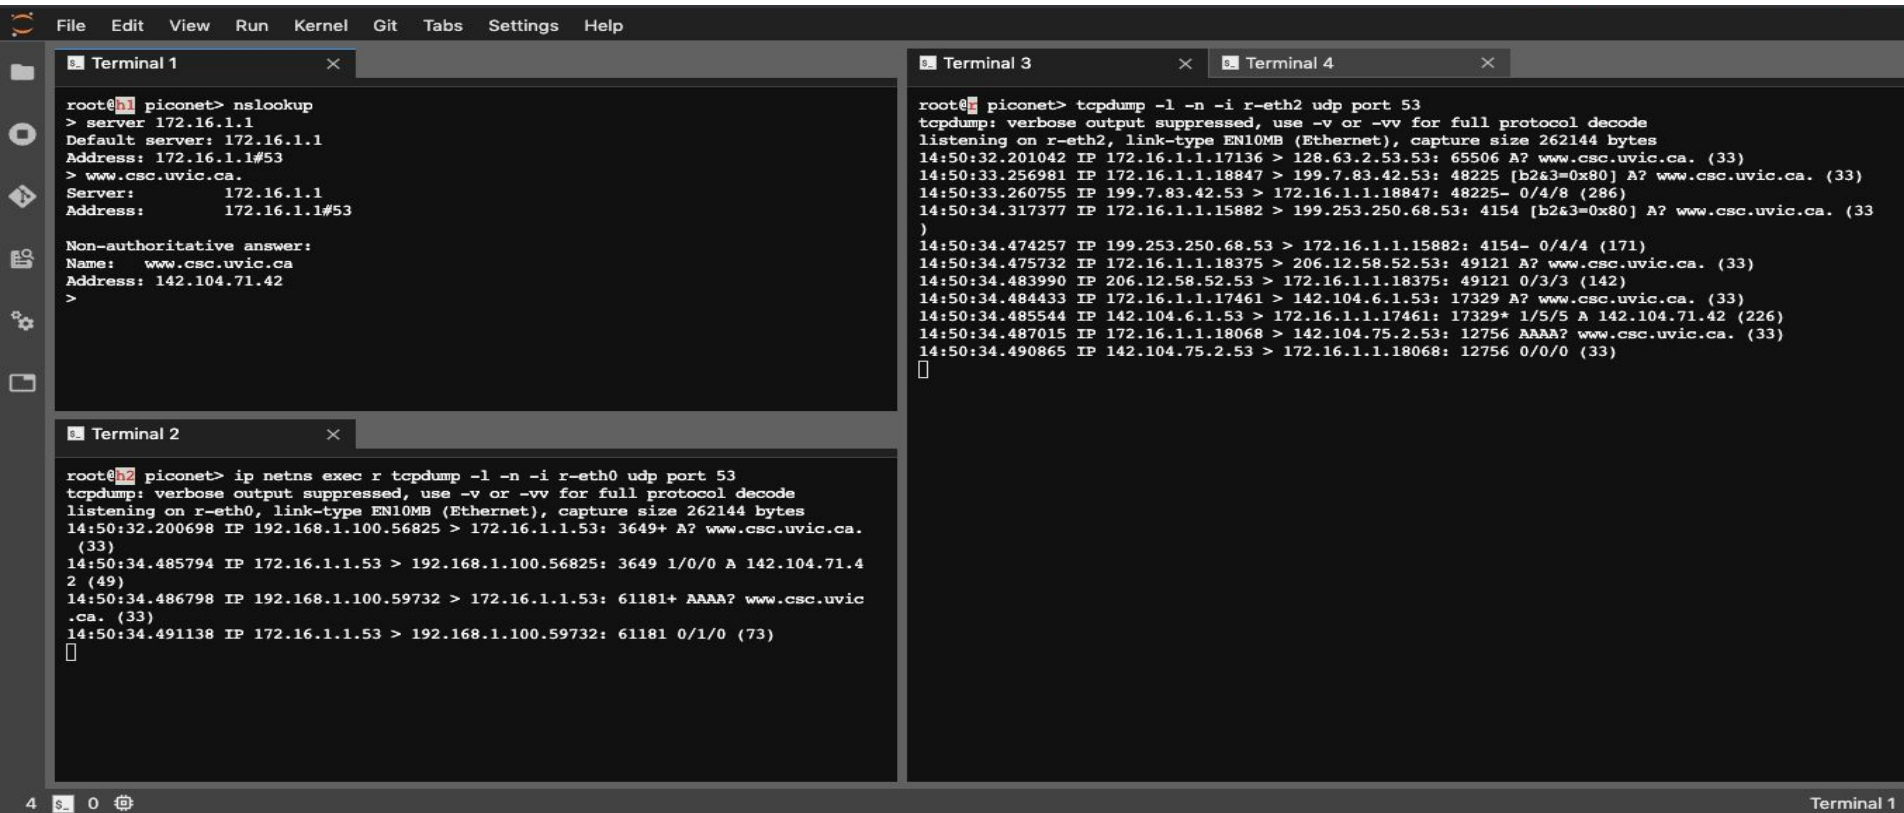

CSc 361

6

In the lab *next* week: recursive vs iterative DNS

```
File Edit View Run Kernel Git Tabs Settings Help

Terminal 1
root@piconet> nslookup
> server 172.16.1.1
Default server: 172.16.1.1
Address: 172.16.1.1#53
> www.csc.uvic.ca.
Server:      172.16.1.1
Address:     172.16.1.1#53

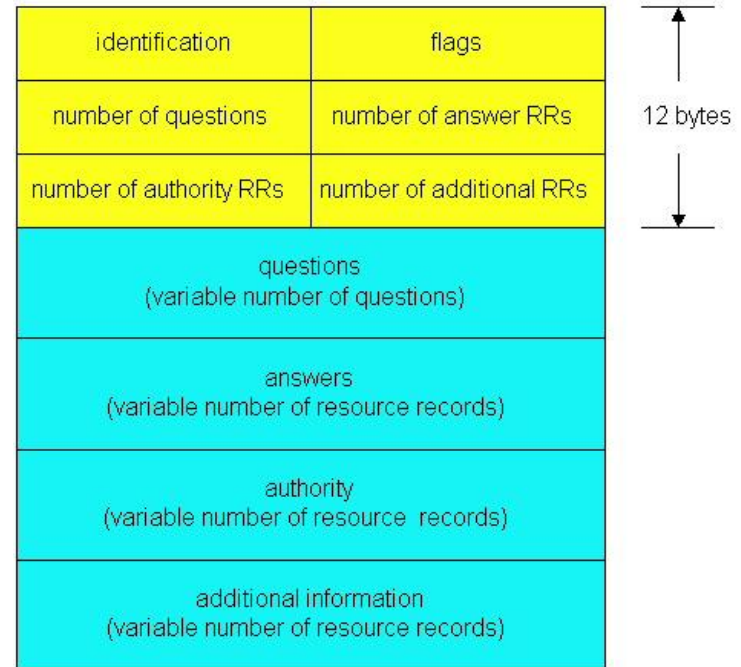

Non-authoritative answer:
Name:   www.csc.uvic.ca
Address: 142.104.71.42
>

Terminal 2
root@piconet> ip netns exec r tcpdump -l -n -i r-eth0 udp port 53
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on r-eth0, link-type EN10MB (Ethernet), capture size 262144 bytes

14:50:34.490865 IP 142.104.75.2.53 > 172.16.1.1.18068: 12756 0/0/0 (33)
```

DNS queries: more

- Local DNS server and higher hierarchy
 - recursive vs iterative
- Reply cache
 - time-to-live (TTL)
- Services required
 - commonly by UDP
- Attacks on DNS
 - cache poisoning

DNS: reality check

- Design goals
 - distributed, hierarchical, low overhead, robust
- Protocol mechanisms
 - cache, weak consistency, redundancy
 - e.g., at least two NS servers per domain in different subnets for redundancy; reality: many are on the same subnet due to poor provisioning
 - e.g., stable name-address mapping for caching efficiency; reality: very short TTL in CDN
- Secure DNS

Akamai content delivery

- Akamai EdgePlatform
 - 15,000+ servers
 - 1,100+ networks
 - 69 countries
 - up to 15% web traffic!
- Server selection
 - DNS-based
 - for site or object delivery

Site delivery

AkaDNS.net

akadns.net DNS servers

Server	IP address	Access network	Location
ZA	216.32.65.105	exodus.net	Washington, DC
ZB	216.52.46.145	bbnplanet.net	Denver, CO
ZC	63.241.199.50	att.net	Dallas, TX
ZD	206.132.160.36	glbx.net	Santa Clara, CA
ZE	12.47.217.11	att.net	Parsippany, NJ
ZF	63.215.198.79	level3.net	San Jose, CA
ZG	204.248.36.131	sprintlink.net	
ZH	63.208.48.42	level3.net	St. Louis, MO

akadns.net NS and A TTL

Ask		Answer			
Name	Server	Refer	NS-TTL (s)	A-TTL (s)	
net.	{a..m}.root-servers.net	{a..m}.gtld-servers.net	172,800	172,800	2 days
akaDNS.net.	{a..m}.gtld-servers.net	z{a..g}.akadns.net	172,800	172,800	
yahoo...	z{a..g}.akadns.net	—	90,000	90,000	~1 day
www...	z{a..g}.akadns.net	—	—	300	5 mins

DNS-based server selection

- Transparent to end-users
- Issues
 - effectiveness (who's making the decision)
 - overhead (low TTL)
 - granularity (hostname vs. service name)
 - proximity (client, local DNS, CDN server)
 - accuracy (*network positioning*)
- Bottom-line: avoid the worst, hope for the best

This lecture

- DNS
 - DNS names and hierarchies
 - DNS resource records
 - DNS resolution queries
- DNS-based server selection
 - “site delivery”: mechanisms, pros and cons
- Explore further
 - CDN: “object delivery”

Next lectures

- This Friday
 - *No lecture*
 - *No tutorial*
- Next week/month: Transport layer
 - read KR4Ch4: Computer Networking
 - Transport layer services
 - User Datagram Protocol (UDP)
 - Transmission Control Protocol (TCP)
